The normal force is defined as the net force compressing two parallel surfaces together; and its direction is

perpendicular to the surfaces. In the simple case of a mass resting on a horizontal surface, the only component of the normal force is the force due to gravity, where $F_N = mg$. In this case, the magnitude of the friction force is the product ...

Friction - Wikipedia

Friction is the force that opposes the relative motion or tendency of such motion between two surfaces in contact. It is a contact force. Friction is a vector, and its direction is opposite to the direction of the relative motion or the tendency of motion. The magnitude of the friction force depends on the nature of the surfaces in contact and the normal force pressing the surfaces together. The coefficient of friction is a dimensionless scalar value that describes the ratio of the force of friction to the normal force. The coefficient of friction is a property of the materials in contact and is independent of the area of contact and the velocity of the objects. There are two main types of friction: static friction and kinetic friction. Static friction acts on objects that are not moving, and kinetic friction acts on objects that are moving. The maximum static friction force is given by $F_{s,max} = \mu_s F_N$, and the kinetic friction force is given by $F_k = \mu_k F_N$. The coefficient of static friction is generally greater than the coefficient of kinetic friction for the same pair of materials.
